AUTHORS: Markov, B. F., Tishura, T. A.

TITLE: Isobaric potentials of the formation of titanium chlorides

PERIODICAL: Ukrainskiy khimicheskij zhurnal, v. 29, no. 2, 1963, 150 - 155

TEXT: Thermodynamic calculations of isobaric potentials of titanium chlorides were carried out on the basis of literature data in order to obtain values for further calculations, since data given by W. J. Hamer et al (J. Electrochem. Soc. v. 103, 1956, 8) and R. B. Head (Australian J. of Chem., v. 13, 1960, 332) are not satisfactory. The isobaric potential for  $TiCl_4$  formation at 298 - 1,200°K was calculated from the thermodynamic constants of chlorine, titanium and titanium tetrachloride found in literature. In the range of 409 - 1,153°K the temperature dependence of the isobaric potential can be expressed by the equation:  $\Delta Z_T^0 TiCl_4 = -180.94 + 0.0291 \cdot T$  kcal/mole with an accuracy of  $\pm 1$  kcal. The isobaric potential of the  $TiCl_3$  formation was determined by means of the following reactions:  $TiCl_4 + Hg \rightleftharpoons TiCl_3 + 1/2 H_2 Cl_2$ ;  $TiCl_4 + Ag \rightleftharpoons TiCl_3 + AgCl$ ; and  $TiCl_4 + 1/2 H_2 \rightleftharpoons TiCl_3 + HCl$ . These reactions were studied already by various authors. The

Card 1/2

Isobaric potentials of the formation of...

S/073/63/029/002/001/006  
A057/A126

dependence of the potential on temperature is expressed for the range of 409 - 1,000°K by:  $\Delta Z_T^0 \text{TiCl}_3 = -170.4 + 0.0541 \cdot T$  kcal/mole with a  $\pm 1$  kcal accuracy.

Based on the isobaric potentials of the disproportionation reactions  $2\text{TiCl}_3(\text{solid}) \rightleftharpoons \text{TiCl}_4(\text{gas}) + \text{TiCl}_2(\text{solid})$  and  $2\text{TiCl}_2(\text{solid}) \rightleftharpoons \text{TiCl}_4(\text{gas}) + \text{Ti}$  the isobaric potential of  $\text{TiCl}_2$  formation was calculated. The temperature dependence for the range of 600 - 1,000°K is given by the equation  $\Delta Z_T^0 \text{TiCl}_2 = -120.1 + 0.0369 \cdot T$  kcal/mole with a minimum accuracy of  $\pm 1.5$  kcal. There are 2 figures.

AUTHOR: Markov, B. P.; Podafa, E. P. 55TITLE: Oxidation-reduction potential of the system Ti sup 2+/Ti sup 3+B in KCl-NaCl melt

SOURCE: Ukrainskiy khimicheskiy zhurnal, v. 29, no. 6, 1963, 600-604

TOPIC TAGS: KCl-NaCl melts, coefficient of activity, TiCl sub 3, TiCl sub 2, Ti sup +3 complex, Ti sup +2 complex

ABSTRACT: The oxidation-reduction potential of the Ti sup 2+ / Ti sup 3+ system in KCl-NaCl melts was determined from potentiometric titration curves of TiCl sub 3 with metallic Ti: at 700 degrees it was 1.807 plus or minus 0.008 v on the chlorine scale. The coefficient of activity of TiCl sub 3 and TiCl sub 2 in KCl and NaCl solutions indicate the trivalent Ti forms more stable complexes than the divalent one. TITLE: Form of cathodic titanium deposits obtained by electrolysis of molten chlorides

SOURCE: Ukrainskiy khimicheskii zhurnal, v. 29, no. 11, 1963, 1155-1157

TOPIC TAGS: titanium electrolytic extraction, titanium electrolytic refining, fused chloride titanium electrolytic extraction method, alpha titanium cathodic deposit, beta titanium cathodic deposit, titanium, fused chloride, electrolytic extraction, alpha titanium, beta titanium, cathodic deposit, electrolytic extraction method, molten chloride electrolysis, titanium cathodic deposit

ABSTRACT: The effect of temperature on the type of cathodic deposit obtained in the electrolysis of titanium was studied in a series of experiments in which all the electrolysis parameters were re-

Card 1/2

ACCESSION NR: AP4000017

tained, changing temperature only (LK18N9T steel reactor, NaCl electrolyte). In electrolysis at 850°, the initial concentration of dissolved titanium chlorides is 2.5-3%, current yield 102-104%, after electrolysis the electrolyte contains divalent titanium chloride, and the alpha-form of metal was deposited. At 1000°, the titanium chloride concentration is 4.5-8 wt.%, current yield 75-85%, the electrolyte contained 15-20% titanium trichloride, and the beta-form was deposited. At constant current, the reversible e.m.f. decreased, leveling off at 50-60 mv. at 850° and 8-10 mv. at 1000°. Thus at the different temperatures there were differences in acceleration of the diffusion processes, in the heterogeneous equilibrium between titanium and its lower chlorides, and in the form and dimensions of the deposited titanium crystals. Orig. art. has: 2 Figures.

TITLE: The Fusion of a Layer of a Metallic Charge Heated From Above  
(Plavleniye sloya metallicheskoj shikhty, nagrevayemogo sverkh)

PERIODICAL: V sb.: Proizvodstvo stali, Moscow, Metallurgizdat, 1956, pp. 227-238

ABSTRACT: To conduct laboratory studies of the process of fusion (F) of a metallic charge (Ch), an experimental installation was designed which consisted of two adjoining chambers: an upper chamber containing the heating unit and a lower chamber containing the basin with the fusible charge. In order to reduce heat losses the internal surfaces of the chambers were coated with Ag and equipped with a system of evaporation cooling. Pb was selected as the charge material because it may be utilized in charges of all shapes and dimensions. The charge was placed into a steel shell fitting snugly into a steel cylinder equipped with a metal cover intended to prevent the charge from rising above the top of the cylinder. The upward movement of the shell was accomplished by means of a special rod actuated through weight

Card 1/2

137 1957 12 23138

### The Fusion of a Layer of a Metal Charge Heated From Above

The advance of the rod is a measure of the settling of the charge. To prevent the oxidation of the Pb the basin is filled with  $N_2$ . For all fusion processes, readings are taken on the variation of the height of the charge layer with time, the amount of heat imparted to the charge, and the temperatures at various points of the layer. A series of fusions, identical in all respects, was performed with interruptions in order to observe the condition of the charge at various stages. A study of the charge cooled at different stages of the fusion process showed that the melt did not flow to the bottom but that it advanced downward along a single front enveloping the solid lumps and giving up its heat to them. In rapid fusion the melt filled all spaces between the lumps, thereby preventing the liquid melt from transferring heat to the lower layers of the charge. From an analysis of the experimental melts the fusion process may be divided into three stages: the heating of the surface of the charge to the melting point, the fusion preceding the complete settling of the layer, and the fusion after the complete settling of the layer and after the formation of a free liquid surface.

TITLE: Cooling of the Panels of Measuring Instruments Used at High Temperatures (Okhlazhdeniye armatury izmeritel'nykh priborov, rabotayushchikh pri vysokikh temperaturakh)

PERIODICAL: Nauchnyye doklady vysshey shkoly. Metallurgiya, 1958, Nr 2, pp. 142-144 (USSR)

ABSTRACT: The system of the air-water cooling makes possible a sufficient measurement of the temperature in the Martin furnace in the tempering and melting processes. The construction and the effect of the thermocouple produced this way are described. A chromium-aluminum thermocouple was used which was protected by a steel tube covered by a chromium-magnesite layer consisting of 85 % chromium-magnesite powder and 15 % refractory clay. The thermocouple tube protected this way permits operation up to 2000°C. In the case of a normal cooling an air-pressure of 4.5 atmospheres excess pressure and a water pressure of 1.5 atmospheres excess pressure are necessary. By means of these thermocouples also on hard conditions, especially at high temperatures, satisfactory results may be

Card 1/2

Cooling of the Panels of Measuring Instruments  
Used at High Temperatures

SOV/163-58-2-3/46

obtained. The air-water cooling can also be successfully used in the construction of various measuring instruments suited for higher temperatures. Its use in longlasting temperature measurements of liquid steel is especially practical. The air-water cooling removes the danger of an explosion when the liquid metals contact the slag. There are 3 figures.

Molding the Heat Exchange in Regenerators (Modelirovaniye teploobmena v regeneratorakh)

PERIODICAL:

Nauchnyye doklady vysshey shkoly. Metallurgiya, 1958, Nr 4, pp 118-123 (USSR)

ABSTRACT:

The formulas (1), (2) and (1a) are set up. The analytical solution of these formulas with the limiting conditions set up represents a rather difficult mathematical problem. It may be found by means of a mathematical machine solving a system of equations directly in differential form. In particular, a hydrodynamic model of a regenerator may be made solving the problem in involving differential form. Such a hydraulic model may serve as a prototype for the making of a quick-acting electric model. The work of such hydromodel is examined applied to air heating. In contrast to the method applied otherwise to set up the differential equations for hydrointegrators with unlimited number of containers, with subsequent transition to the involving differential form for apparatuses with limited number of containers, here the involving-differential operations

TITLE:

The Influence of the Real Surface of the Open-<sup>Hearth</sup> Tank on the Heat Current Received by It (Vliyaniye fakticheskoy poverkhnosti martenovskoy vannы na poluchajemyy yeyu teplovoj potok)

PERIODICAL:

Nauchnyye doklady vysshey shkoly. Metallurgiya, 1963, No. 1, pp 90 - 93 (USSR)

ABSTRACT:

As a rule, all computations of the heat exchange are referred to the surface of the tank bottom. In fact, however, the real surface differs considerably from that of the bottom. Figure 1 shows this difference in the furnace charge. Also the billowing, blistering melt still has a surface by 1.6 times larger than the tank bottom. At first, the simplest case of heat transmission in atmosphere pervious to rays is investigated. The heat current received by the bottom surface and by the real surface from the furnace arch is computed by the formula of heat exchange in a closed system. Figure 2 shows the results for three values of blackness degree of the surface

Card 1/3

The Influence of the real Surface of the Open-Hearth Tank on the Heat Current Received by It

(with an absolutely black surface, the kind of its formation is without influence). At the degree of blackness  $\xi_{\text{III}} = 0.7$

occurring in practice, the difference of the two heat currents is only 16%. A different situation prevails if the working room is filled with radiant gas. Under the assumption that the gas shows the same degree of blackness in all directions, the ratio between the heat currents of the tank bottom and of the real surface is computed by the equation of H. C. Hottel (Ref 2). Figure 3a shows this dependence. The heat current increases with an increase in the real surface and with a rising degree of blackness. Figure 3b shows the result of a second computation, which better corresponds to practical conditions, under the assumption that the gas shows different degrees of blackness in different directions. At all times, the influence of the real surface on the heat current is great. In quiet boiling, the heat current computed for the tank bottom will be 20% low. In charging and heating-up, this difference may amount to 50 - 100%. There are 3 figures and 4 references, 2 of which are Soviet.

TITLE: On the Working Method of Introducing the Charge of the Open/  
Furnace in the Scrap Process (O rubezhenie zavaliki ma. tonovoyay skrapy pri  
skrap-protssesse)

PERIODICAL: Nauchnyye doklady vysshey shkoly. Metallurgiya, 1959, Nr 2,  
pp 117 - 122 (USSR)

ABSTRACT: This investigation deals with the problem concerning the most  
convenient kind of charging (at maximum temperature or at a  
lower temperature, in which sequence and rate), from a pyrometric  
point of view. The model investigation was carried out with co-  
operation of Engineer L. Vatslavik on a Budrin-Lukyanov hydro-  
integrator (Fig 1), the vessels of which are used as models for  
the temperature of arch and bottom, for the charge and its temper-  
ature, and which are connected by hydraulic resistors (capillaries)  
which work as analogs to the heat transmission. By means of an  
integrator, the heating of the charge was computed per 1 m<sup>2</sup> of  
bottom surface during the charging in 1,2,3, and 4 layers. The  
results are illustrated in figures 2 and 3. The values are too  
low as compared with practical data, since in practice not 4, but

Card 1/2

On the Working Method of Introducing the Charge of the Open-Hearth Furnace in the Scrap Process SOV/163-19 2-21, 58

10 - 20 layers are charged. The following conclusions are arrived at: 1) The charging is to be carried out under maximum heat load; 2) charging in thin layers is of advantage; 3) the rate of charging should be chosen so that the layer previously introduced is covered by the subsequent layer when its surface begins melting. There are 3 figures, 1 table, and 5 Soviet references.

Pavlov, Corresponding Member, Academy of Sciences USSR; and A. N. Pochvitsny, Professor, Doctor of Technical Sciences.

PURPOSE: This book is intended for technical personnel in industry, scientific institutions and schools of higher education, dealing with open-hearth and electric-arc furnace steelmaking, metal rolling, physical metallurgy, metallography, and heat treatment. It may

Card 1/10

also be used by students specializing in these fields.

COVERAGE: The book contains results of theoretical and experimental investigations of metallurgical and heat-engineering processes in open-hearth and electric-arc furnaces. Data are included on the following: details of pig iron outside the blast furnace, interaction of the carbide-forming metals with solid carbon, change of content of gases in the bath of the open-hearth furnace in various periods of melting, intensification of the electric melting of steel, etc. Other articles deal with the nonuniformity of deformation in rolling, the study of the continuous rolling process, the dependence of the reduction and slippage coefficients in rolling on a number of factors and other problems in the pressworking of steels. Theoretical and physical metallurgy and the theoretical principles and techniques of the heat treatment of steel are also included. No personalities are mentioned. References accompany most of the articles. There are 207 references, both Soviet and non-Soviet.

TITLE: Measurement of the radiant properties of a flame with a radiometer without means of condensation <sup>21,44,55</sup>

SOURCE: Inzhenerno-fizicheskiy zhurnal, v. 9, no. 1, 1965, 64-69

TOPIC TAGS: flame, flame temperature, radiometer, thermal battery, heat transfer coefficient, black body radiation

ABSTRACT: The article gives construction details of a radiometer without means of condensation which gives sufficiently accurate measurements of flame properties, using the Schmidt method for calculation. A simple model was first constructed which consisted basically of a thermopile and three diaphragms or orifice plates. Experimental results from this type of radiometer were unrealistic. Analysis led to the conclusion that the reason for the errors in measurement was turbulent pulsations of the flame which, penetrating to the thermopile, increased

Card 1/2

L 64318-65

ACCESSION NR: AP5020215

the heat transfer coefficients at the electrode and at the "base", and intensified the field. A new model was constructed with a larger number of diaphragms to eliminate the effect of turbulent pulsations. The body of the instrument and the diaphragms were made of copper and the diaphragms were welded to the body. The article shows a schematic with construction details. Scatter of the readings, calibrated against a black body, does not exceed 1%. Preliminary evaluation of the Schmidt method in this instrument yields the following maximum possible errors: radiation of the flame, 1.5%; absorptive capacity of the flame, 6.5%; and, temperature of the flame, 5%. The accuracy achieved in practice was less, the scatter of the readings being 10-15%. Orig. art. has: 9 formulas, and 3 figures

TITLE: A radiometer, Class 42, No. 178527

SOURCE: Inzheneriya, promyshlennyye obratsy, tovarnyye znaki, no. 3, 1966, 74

TOPIC TAGS: radiometer, combustion chamber test

ABSTRACT: This Author's Certificate introduces a radiometer for measuring the radiation of a flame jet in a combustion chamber. The instrument contains a housing and two principal diaphragms which limit the radiation beam falling on the heat sensor located behind them. Measurement accuracy is improved by placing a set of auxiliary diaphragms between the two principal diaphragms. Two types of these auxiliary diaphragms are alternated: the first type has a central aperture with an axis at an angle to the optical axis of the radiometer, and the second type has a central aperture with an axis which coincides with the optical axis of the radiometer and two additional apertures along the periphery. TITLE: Instrument for mounting rotor blades of a turbine. Class 14, No. 168726

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 5, 1965, 29

TOPIC TAGS: turbine, <sup>16</sup>turbine blade, gas turbine

ABSTRACT: This Author Certificate presents an instrument for mounting the rotor blades of a turbine, such as a gas turbine, by means of a shaft placed in grooves in the disk rim (see Fig. 1 on the Enclosure). To simplify the construction and increase the reliability, the blade stems and the disk rim have slots forming continuous grooves. These grooves are cut to place a split-ring held by a bushing rigidly clamped to the disk. Orig. has: 1 figure.

cyclotron

**PERIODICAL:** Zhurnal tekhnicheskoy fiziki, v. 33, no. 4, 1963, 462 - 469

**TEXT:** In order to produce intense beams at a radius near to the final one  
in the 300 cm cyclotron for the acceleration of heavy ions of the  
laboratory for nuclear reactions ОИЯИ (ОИЯИ) it was calculated that at a  
frequency of 5 Mc/s a potential difference  $2 V_0 = 300 - 350$  kv between  
the dees should be applied. It was found, however, that for dee voltages  
above 100 to 150 kv a strong electronic load of the resonance circuit  
spoil its quality factor, and that the dee potential was considerably  
reduced (by the factor  $\sim 1.5$ ) when the external magnetic field was switched  
on. The distance between the dees and the cover of the chamber was 10 cm.  
The electron current over this gap was studied by recording the continuous  
spectrum of soft bremsstrahlung by means of a scintillation counter  
Card 1/2

Investigation of the...

B163/B234

arranged outside the vacuum chamber, through a plexiglass window. The pulse recurrence frequency was varied between 10 and 150 c/s, the pulse duration from 0.2 to 3.0 n sec. The vacuum in the chamber varied from  $1.5 \cdot 10^{-5}$  to  $5 \cdot 10^{-6}$  torr. The  $\gamma$ -counting-rate  $N_\gamma$  increased by a factor of  $10^6$  to  $10^7$  when  $2 V_0$  was increased from 50 to 300 kv. The spectral distribution of the  $\gamma$ -rays drops steeply at  $E_\gamma = e V_0$  and becomes much less intense for  $e V_0 < E_\gamma < 2e V_0$ . The measurement of this spectral distribution can be used to measure the dee voltage with an accuracy of 3%. The dependence of  $N_\gamma$  on the magnetic field strength  $H$  is characterized by a steep ascent up to 1000 oersted, and a constant value of  $N_\gamma$  between 1 and 16 kiloersted. For high  $H$ ,  $N_\gamma$  is proportional to the duty factor. No dependency of  $N_\gamma$  on the vacuum was observed. There are 5 figures.

**TITLE:** Gamma radiation from nuclei with high spins

**PERIODICAL:** Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 44, no. 4, 1963, 1171 - 1179

**TEXT:** The authors measured the  $\gamma$ -ray spectra emitted on bombardment of Cu, Ta, W, and U targets with  $O^{16}$  and  $Ne^{22}$  ions accelerated to energies between 74 and 145 Mev, by means of a single-crystal scintillation spectrometer. For the reactions  $Cu+Ne^{22}$  and  $Ta+O^{16}$  the upper limits of the cascade  $\gamma$ -transition times were also determined. The projectile ions were accelerated in the 300-cm cyclotron of the Laboratoriya yadernykh reaktsiy OIYaI ( Nuclear Reactions Laboratory of the OIYaI). The targets had natural isotope composition and were, at thicknesses of from 25 to 100 $\mu$ , deposited on copper backings. The spectrometer consisted mainly of a NaI(Tl) crystal and a photomultiplier whose pulses were fed to a AM-100/1 (AI-100/1) 100-channel pulse height analyzer. In some experiments the  
Card 1/2

Gamma radiation from nuclei with high spins S/056/63/044/004/010/044  
B102/B186

neutron yield was also measured by means of a stilbene crystal with an ФЭУ-33 (FEU-33) multiplier. The  $\gamma$ -counting rate was 100-300 pulses/sec for a flux of  $\sim 10^{12}$  ions/sec. The spectrometer was positioned at an angle of  $115^\circ$  with respect to the ion beam. In all cases a prompt gamma radiation ( $< 10^{-9}$  sec) was observed with mean energies between 0.7 and 1.1 Mev. The upper limit of the cascade emission time was  $(2-3) \cdot 10^{-9}$  sec. Up to 13 gamma quanta were emitted per compound nucleus decay. The spin effect on the decay mechanism is discussed separately for the various reactions. There are 6 figures and 1 table.

TITLE: Device for automatic control of stepped shafts during their grinding 18

SOURCE: Izmeritel'naya tekhnika, no. 4, 1965, 21-23

TOPIC TAGS: shaft grinding, size control

ABSTRACT: The development of a pneumatic gage for controlling the size of large stepped shafts in the course of their grinding is reported. The shaft is measured by prisms 1 hinged on lever 2, see Fig. 1 of the Enclosure; compressed air taken from the plant air system enters gage 3 and then, via gap z, is released into the atmosphere. Pressure in the gage chamber depends on the value of z. As the grinding allowance is taken off, the pressure in 3 decreases, and point 5 moves until the upper-chamber pressure becomes equal to the lower-chamber pressure. The maximum z that permits measurement is 0.35 mm; scale resolution, 0.2 mm. The instrument is being tested on a grinding machine that handles 235-165-mm shafts. Orig. art. has: 1 figure and 8 formulas.

fissionable isomer  $Am^{242}$

SOURCE: Yadernaya fizika, v. 5, no. 1, 1967, 22-25

TOPIC TAGS: americium, boron, nuclear isomer, nuclear spin

SUB CODE: 20,11

ABSTRACT: The reaction  $U^{238} + \beta^{11}$  leading to the ground (1-), isomeric (5-) and spontaneously fissionable states of  $Am^{242}$  was investigated. The excitation functions have been obtained for the ground and spontaneously fissionable states. For the 5- state, the averaged cross section has been measured in the energy range 50-68 MeV. The spin of the spontaneously fissionable state was evaluated by comparing the cross sections for the production of  $Am^{242}$  in various states. The authors thank G. N. Flerov for constant interest in the work, V. P. Pereygin and coworkers of his group for processing and examining the glass detectors, K. A. Gavrilov for preparing the targets, and B. A. Gvozdev

**Authors** : Markov, D., and Dmitriev, S.**Title** : Superheterodyne battery receiver**Periodical** : Radio 11, 53-55, Nov 1954

**Abstract** : A simple, four-tube battery-type superheterodyne receiver, assembled mainly from parts from the "Moskvich" receiver is described. The receiver operates on long (723-2000 m) and medium (167-578 m) wave-band ranges. Particulars pertaining to the receiver's parameters are set forth. A general layout diagram including a circuit diagram showing the arrangement of parts and featuring the separate stages in each of the bands, the various types of capacitors, filters, oscillating circuits, and the tubes used, is presented. The description of the chassis is given along with tabulated detailed data on transformer coil-windings. The types of storage batteries used and their designations and the voltages required for normal operation and for increasing the volume are also given. Circuit diagram; illustrations; table.

SUBJECT: USSR/Welding

135-10/16

AUTHOR: Markov D.A., Engineer

TITLE: To the Question of Modernizing the Welding Equipment for Light Alloys. (K voprosu modernizatsii oborudovaniya dlya svarki legkikh splavov).

PERIODICAL: "Svarochnoye Proizvodstvo", 1957, #4, p 25 (USSR).

ABSTRACT: The short article represents a letter in response to the article by GLEBOV and RADASHKOVICH in "Svarochnoye Proizvodstvo" # 8, 1956, dealing with equipment modernization.

The author agrees that production of new machines and modernization of the welder "МТН-300А" are necessary and important, but has the opinion that the equipment already existing should be modernized first, especially as the new, high-power equipment is short in supply. GLEBOV and RADASHKOVICH just listed general directions for modernization, but the industrial plants need definite instructions, plans and drawings for modernizing the existing equipment. It is known that the "Elektrik" plant has long ago developed a welding current stabilizer for the spot and roller welding machines, but it is still missing in

Card 1/2

135-4-1012

TITLE: To the Question of Modernizing the Welding Equipment for Light Alloys. (K voprosu modernizatsii oborudovaniya dlya svarki legkikh splavov).

the consumer-plants which use the "HMAT" stabilizer.

The author's plant has modernized the welder "MTN-200", including the pressure system, and raised the short-duration power by the method recommended in the article by BALKOVETS and CHULOSHNIKOV in # 12 of "Svarochnoye Proizvodstvo" in 1955, as well as introduced the electronic welding current modulator developed by "HMAT". After modernization, the device welds without defects the light alloys "Al6T" and "AMF" in depths of 2.5+2.5 mm. The power of the roller-welder "AFT" of 150 kva is increased by connecting it with the welding transformer "CT-34". The device welds light alloys in depth 1.5+1.5 mm. Neither the welder "MTN-200", nor the roller-welder show any overheating of the windings.

Investigations by Belorussian Scientists in the Field of Spectroscopy and Luminance (Naboy belorusskikh uchenykh po spektroskopii i luminantsentistit)

Footnote Akademii nauk SSSR, 1959, Nr 1, pp 68-76 (USSR)

These investigations are being carried out at the Institut fiziki i matematiki (Institute of Physics and Mathematics) and the fizicheskii fakul'tet Belorusskogo universiteta (Physical Department, Belorussian University) under the direction of B. I. Stepanov, A. S. Seroko, B. A. Kozlov, M. I. Shcherbin, Academician AS SSSR, and P. I. Fedorov, Corresponding Member, Academy of Sciences, SSSR. In the field of theoretical spectroscopy, the investigations by P. A. Ivanovskiy, B. I. Stepanov and others are mentioned. Further, the following investigations are indicated:

- A. Z. Krizhnyak and B. I. Stepanov developed a theory of dispersion light filters.
- B. A. Borisavich, Ya. S. Khvachchinskaya, A. F. Lepshovich examined, by experiment, dispersion light filters for the infrared range.
- A. P. Prishayko analyzed the accuracy and the field of application existing at the present time of methods of optical spectroscopy of dispersed materials.
- L. G. Kuznetsov, A. A. Labuda, Ya. G. Marinkov obtained important results concerning the kinetics of one single spark discharge (spectral intensity and discharge temperature).
- A. A. Jankovskiy, V. S. Kurakov examined the actual influence of elements in spectrum analysis, and explained the methods for their elimination.
- G. V. Oveshkin suggested a series of methods to eliminate the influence of third elements.
- G. V. Oveshkin, M. P. Krizhnyak succeeded in working out a control method of benzyl penicillin in ordinary penicillin.
- B. A. Borisevich, E. I. Kabanich, A. I. Shvartz examined the infrared spectra of resinous products.
- B. A. Borisevich, Y. I. Panazich, I. P. Gulinich examined a series of structural peculiarities of alcohol oxides.
- B. A. Borisevich worked out a luminescence method for the detection of the germinating power of the seed of some kinds of trees.
- B. A. Borisevich obtained good results by the use of luminescence analysis in dermatology.
- B. S. Khramenko examined the absorption spectra of the albuminous polysaccharide complexes.
- B. A. Kartov used spectral methods for analyzing albuminous fractions in the blood.
- B. M. Pavlyuchenko, G. A. Kuzirko, carried out an extensive spectrofluorometrical examination of the formation of molecular and complex compounds in solutions.
- B. A. Seroko spectroscopically examined the structure of various silicas.
- B. I. Stepanov, A. M. Prif, carried out theoretical investigations of the vibrational spectra of various silicate crystals.

PHASE I BOOK EXPLOITATION

SOV/517A

Pravda, Moscow.

Voroy Sovetskiki kosmicheskii korabl'; materialy, opublikovannye v gazete "Pravda" (The Second Soviet Cosmic Ship; Materials Published in the Newspaper "Pravda") Moscow, 1960. 198 p. 50,000 copies printed.

Resp. for this Publication: V. Reut and V. Saimov; Tech. Ed.: V. Yagodka.

PURPOSE: This book is intended for the general reader.

COVERAGE: The book is a compilation of articles which appeared in the newspaper Pravda after the launching, orbiting, and recovery of the capsule of the Soviet 4,600 kg spaceship on August 19, 1960. The articles give some details of scientific research undertaken in this flight in the fields of biology, cytology, genetics, cosmic radiation, solar radiation, ultraviolet radiation, and radiation levels. A description and three photos of the capsule are given. No personalities are mentioned. There are no references.

Limitless Perspectives. Y. Fedynskiy, Doctor of Physical and Mathematical Sciences 90
